"Effect of Aerosol Inhalation on the Respiratory System of Rats After Sulfuric Acid Action"

Prague, Pracovni Lekarstvi, Vol XV, No 5, June 63, pp 192-196.

Abstract [Authors' English summary, modified]: "described is an experiment with 30 rats, who inhaled fifty-percent sulphuric acid aerosols 30 minutes daily for two and a half months. One group of ten inhaled the Vincentka mineral water, another inhaled a salt mixture enriched with camomile extract or a ten-percent calciumthiosulfate, and the third group inhaled H₂SO₄ without any protection. Histological examination of the third group showed severe degenerative changes of bronchial mucosa with patchy ulcerations, mound-shaped infiltration of lymphadenoid tissue, and increase in the volume of connective tissue. Regenerative and inflammatory changes were developed much less in the first and second group. Twenty-six references, including 14 Czech."

Title : Preservation and Action of Emulsions for Injection.
Orig Pub : Scripta med., 1956, 29, No 3-4, 113-120

Abstract : It was found that the most effective means for sterilizing the injection emulsion of estradiol benzoate, stabilized with mucin (I) derived from flax seed, is merthiolate (II), at a concentration of 1 : 10 000. On the use of II the biological action of the preparation is somewhat slowed down. Combined use of antibiotics and gentian violet results in acceleration of biological action but is unsatisfactory from the bacteriological standpoint. Sterilization of the emulsion does not affect its stability and biological properties. It was confirmed that the use

The skin of certain experimental animals (frogs and rats) was softer and more easily torn following the administration of lactic acid. Rats lost their fur, and in a series of experiments carried out in the autumn, the ends of their tails became necrotic. Following the administration of lactic acid and lactates, the rats gained more weight (fat and musculature) than the controls. In pigeons, inhibition of keratinization processes was observed following both lactic acid and lactates. Lactic acid inhibits the production of keratin and it is assumed that this effect is of general biological significance.

"Functional Troubles of the Lower Section of the Cervical Spine."
Prague, Vojenske Zdravotnicke Listy, Vol 35, No 6, Dec 66, pp
268 - 269

Abstract: Chiropractic and osteopathic treatment of the disease, which was introduced to Czechoslovakia recently by HENNER, is discussed. The main advantage of these methods lies in their use in diagnosis of the functional disorders of the spine. Diseases where these methods may be of help are described. Contraindication of these treatments, such as conditions after an operation, a fracture, tumors, inflammations and so on, are discussed. Relationship between disorders of the lower section of the cervical spine and the central nervous system is evaluated. 5 Western, 11 Czech, 1 East German reference.

4821. POLÁK E. Chir. Klin. Lék. Fak. Hyg., Praha. *O nerecidivujících formách chronické pankreatitidy. Non-recurring forms of chronic pancreatitis ČAS.LÉK.ČES. 1956, 95/23-24 (644-648)
In addition to chronic, recurrent pancreatitis, which is characterized clinically by the recurrence of acute attacks of inflammation in the chronically inflamed terrain, rare chronic forms of pancreatitis occur which do not exacerbate in this manner. The author deals with the non-icteric form of hypertrophic pancreatitis. In one case of this type, which was followed in detail and is described more fully, an extremely large tumour of the whole pancreas was found at operation in 1939; macroscopically this was classified as a malignant tumour. After a simple laparotomy, however, the tumour gradually disappeared, leaving as a sequela sclerosis of the pancreas, manifested endocrinologically by poor secretion. The patient was followed up for a period of 15 yr. and was without symptoms. An analysis is also made of 3 cases of 'chronic colliquating pancreatic necrosis', in the second of these the symptomatology was slight and the condition likewise had a pseudotumorous character. After the drainage of one focus of colliquation, healing took place. The genesis of this pancreatic condition is probably similar to that of pseudo-cysts, the difference being that the cortex of the pancreas is not broken down and the pancreatic juice does not escape. The position of surgery in relation to this condition is not clear and there are no guides in the literature. The most practicable is perhaps conservative therapy, leading finally to scarring; in extensive necrosis, in the author's 2nd case, drainage of only one of the many foci proved sufficient in circumscribed processes, partial resection of the gland may perhaps be recommended.

1861. OPERATIVE TREATMENT OF BRONCHIOGENIC CARCINOMA - Polák E.
Surg. Clin., Fac. of Med. (Hyg.), Charles Univ., Prague - NEOPLASMA
1958, 5/3 (293-302) Tables 4

The operative treatment of bronchogenic carcinoma, its justification and indications are discussed, based on statistics from the literature and on a review of a personal series of 159 cases of resection. The author adopts a positive attitude in the question whether operative treatment is justified in small-cell cancer, gelatinous carcinoma and Pancoast's tumour. Preoperative diagnosis based on biopsy is not absolutely necessary. Exploratory operation should be performed when cancer is only suspected. This statement is corroborated by the enumeration of cases of possible erroneous diagnoses, all of which are indicated for operative treatment. Lobectomy in lung cancer is especially justified in its asymptomatic peripheral form and when there is little cardiorespiratory reserve. (IX, 5, 15, 16)

The suitability of various alcohol fractions for the production of vinegar. B. Kamiński and R. Polak (Univ. Kraków, Poland), *Przemysł Rolny i Spółwczesny* 4, 97-102 (1950).— Various kinds of inferior-quality alcs. contg. large quantities of lower- and higher-boiling by-products have been examd. as a raw material for vinegar fermentation in a pilot-plant fermentor filled with approx. 200 l. of beechwood shavings. Neither inferior-quality alcs. nor ethanol contg. 7.5-15% amyl alc. cause any disturbances in the fermentation as compared with pure ethanol; hence any irregularity in the industrial vinegar fermentation should be ascribed to factors other than impurity of tech.-grade alc. (O przydostosci pewnych spirytusow do produkcji octu). Przerysl Rolny
i Spozywczy. No 5, 1950, pp. 97-102, 1 fig, 3 tabs.

Semi-technical research was carried out to determine the suitability of inferior spirits, containing considerable quantities of methyl alcohol, fusel-oils, esters, acet aldehyd for working-up vinegar through fermentation. It was ascertained that the processing of vinegar progresses normally - just as in the case of processing mixtures of spirits containing amyl alcohol. Description and calculation of the capacity of an apparatus for carrying-out tests.
